CS410 Project - Team Reddit Recommenders

1) Which tasks have been completed?

We have divided the project tasks among group members. Kimberly and Miguel will work on scraping and indexing the text data from various subreddits. Ethan and Anthony will work on implementing the content-based filtering algorithm. Nico and Miguel will work on creating the user interface for the recommendation system.

2) Which tasks are pending?

The group has many tasks pending, namely to implement the subgroups' tasks and begin to join the parts together. In our last group meeting we discussed specific logistical issues such as the number of subreddits to analyze and which similarity functions to use. We are now working on implementing our tasks in subgroups and communicating any difficulties with the team so that we can assist each other when needed.

3) Are you facing any challenges?

The group's initial challenge was getting all of the group members to meet at the same time, but we have settled on future group meeting times to continue communicating our progress. We anticipate facing additional challenges, as a project of this scope is new to many of the group members.
